The shift to a zero-environmental impact and circular economy proposes realizing a new society through new social systems and political choices.

These are proposals for a politically led shift to the next society.

And we have all the progress of academics and technologies which permit us to recreate the world.

The new ideal of coexistence can be realized by transitioning to the next society, society, and life with lasting and new possibilities.

These are the creations of a new nation through political choices and decisions.

As we see, political decisions make all these things possible. And we are given new hopes in politics.

The next society may be the dream and evolution of all realities, which contains all new technology and systems.

This causes us to make all new social and national systems, which is the all-new basis of the new future.

We see a new philosophy is required to build a new paradise from any past tragedy.

All these are from politics, giving us a new reality with new hopes.

These ideas propose creating a new society and nation through collaboration between industry, academia, and government and realizing a new future.

We know these are given and realized under political decisions and new consensus.
