

## Ecosystem construction

Dinosaur domination in the Jurassic has its predation and ecosystem in the strong. The extinction of dinosaurs has provided the construction of new ecosystems in the adaptation of mammals to new environments. These prove that the principle of balance seeks an ecosystem. The birth of mankind has transformed into the domination of ecosystems in intelligence. Intelligence demands complete control of the ecosystem in its progress. In any case, it is the only reality that the strong man has the world. Reason shares its shared nature and asks the world in its philosophical consideration. Predatory habits provide a survival requirement in one's essence. The absoluteness of survival still cannot be overcome in the world. The reality of the food chain is an absolute reality other than humans. These have complete contradictions in theory in the world. Darwin's theory of evolution is the correct proof of world progress, and we have a future with it. The future is permanent, and what is inherited there is the reality of intelligence. It gives the world and gives the self.
