Ideas

 The construction of a metaverse on a digital map provides each individual store with the ability to create a digital space on the map. These provide a unified framework and propose EC environment and digital service environment as possible. We would like to propose development and provision of these as open source, such as participation in the Metaverse space from the website, development of original applications, and cooperation with other Metaverse spaces.

 We would like to propose the possibility of sharing all digital services and providing them in a unified standard, such as a game environment for avatars on the map, digital currency, an environment for participation in a unified ID and access to personal information.

 In addition, a digital information can be provided for describing store information. We think it is possible to link with a car navigation system.

 We believe that Uber Eat's product delivery service can be developed as a service.

 We also think that we can propose the possibility of managing self-location data in map data.

Detail

We would like to propose the possibility of a standardized system in various stores and the creation of a metaverse space.

Problems

We believe that simplification of the framework in system development will enable easy development, but we believe that the development of a digital service environment at individual stores will require high development capabilities.

Solution

We would like to seek solutions for these issues through development collaboration with major companies.

Market

We believe that high playfulness and high service can be constructed as core competence, and can be proposed as a new core system in life.

Business model

We would like to develop a possible profit environment in B TO B in open source.

Purpose of the project	Creating Possibilities in the Fusion of the Metaverse and Digital Maps
Business Goals	Monetization of business in commercialization and construction of IT environment

Customer	Competitor (competitor)	Company
We believe that the construction of services for living demand can propose possibilities in building services and expanding services to meet large demands.	We believe that competition with all metaverse services is not a significant competition in terms of uniqueness。	This is before the establishment of the company and is limited by ideas.

conclusion	We believe that new functional services as similar to Google Maps and others can propose expansion into various uses and possibilities.
Strategic Policies and Proposed Measures	We want to establish openness of our business, such as standardizing with other metaverse service.
