

Providing services and maintaining terminals for cloud host access of OS and applications

Performing server access on the host at the terminal and providing all application services, along with ID access, builds a new IOT service.

On the terminal, they display the OS and applications on the host server and provide all application services in a monthly subscription.

These are provided in the access environment and ID access in the server environment and in the terminal, and propose services in providing data in the server host instead of IOT access in the existing OS and application.

We would like to propose cost reduction and transition to subscription of necessary services, simplification and improvement of user services in the selected environment.
