

Building a new society in local and central politics

Kuroda International Foundation

Takeshi Kuroda

Social transformation at the IOT has enabled the creation of a new lifestyle in the United States. These social transformations have the creation of new lifestyles.

Industry 4.0 and smart cities are no longer an illusion in the business field, and trends in new eras such as 3D printers are already a reality.

Therefore, there is always a need for regional development in collaboration with companies in local politics and urban development in collaboration with universities as model cities.

On the other hand, the enjoyment of these new lives by all citizens calls for new consensus in politics.

In local politics, the management of civil society and its obligations to life are required to clearly provide basic life and participation in society in the new era. This is to improve the social learning environment, purchase products, and provide a learning environment for cutting-edge services, which can provide citizens with participation in these new realities in the next generation.

Building a basic lifestyle provides reference and learning as a model.

The creation of a new society builds dramatic efficiency and convenience on the basis of new systems and technologies.

In all these local cities, the transition to the next generation and the transition to new social construction are clearly required as political consensus. That is because they already dominate reality.

There is a distribution of these in the new era. The existence of the elite in the world already has reality in another dimension. Therefore, social development based on world standards and cutting-edge is possible, and there is a need for it.
