Delivery service in supermarket

In uploading electronic catalogs, along with contracts with delivery companies, we will provide direct sales services in supermarkets in the construction of web frameworks.

These are for consumers to use the home delivery service when receiving orders for WEB catalogs, and for customers to automatically forward orders, such as registering repeaters, and requesting receipt and delivery of products, supermarkets. I would like to get the construction of services such as maintenance of eco-bags, product packing and time designation.

For these, we would like to improve the framework on the website and provide services by subscription.

For registration of own store and upload of product data in the framework, we propose a delivery service from the website.
