Virtual reality space

For maps and buildings, we will set up shops in virtual space and improve the product sales environment to create space in virtual reality.

These are clearly owners, who, in their participation, set up their own shop. Various stores will provide their own services and products to the virtual space on the Internet, and develop these integrated spaces.

The cooperation between the car navigation system and the map software provides such information.

We believe that the integration of various digital services can make participation in all of them into a game and propose various possibilities.

For sharing personal location data on a map, I would like to propose a search for a friend's location and an integrated environment with a communication service.

I want to make playfulness a reality, such as participating in virtual space with own Avatar.
