

A 500% improvement in the cost efficiency of government spending and the possibility of creating a new reality in it

KURODA International Consulting
Takeshi Kuroda

How may the government ask for reality if financial spending comes with a 500% efficiency improvement?

We have all technological progress today. We may ask for its use for the new social infrastructure, communication infrastructure, and transportation system.

These are the recalculation of new standards in politics with its consensus. And all these cost efficiencies permit to build of all new realities.

Limited government by IT control permits all new systems and standards.

These may be with the new social system and the new presence of politics.

These represent a complete national transformation under the new standards. The necessary technology and quality in all expenditures will require the necessary functionality as well as the utilization of cutting-edge technology, and the development of the self-industry will lead to a shift to a new reality.

Onto the other reality, we may move toward the standard of society 5.0.

We will ask excellent bureaucrats to present their possibilities and submit plans to realize the transition to a new national reality.

These establish a self-economy zone, form a self-group in the money system in the world, and seek a breakthrough in reality in diplomacy.

A unified Asian concept can make all of this possible.
