

A society with a birth rate of 2.0 children and the transition to a next-generation society through the use of new technology

February 22nd, 2024

KURODA International Consulting

Takeshi Kuroda

As we see the society and livelihoods of France, these only make it possible with a 2.0 birth rate. We see we have all the new technology to rebuild civilization.

These are the possibilities we have today, and we are willing to make a future.

These are new designs of society, and technology has a use for them to make the future. And we have completed all growth of domestic industry under all new requirements and decisions of the nation.

These call for infrastructure and detailed planning in rural and urban areas to build a prosperous society and life. On the other hand, they provide for the transformation of society and life through the use of new technologies.

These are the agreements of politics to recreate society and lifestyles. Together with close cooperation between local and central administration, these will embrace and realize a new national image.

It is possible to work with talented bureaucrats to create a plan and design for a transition to a new society and, together with political decisions, to realize the transition to a new reality.

All these are the shift from ancient to the future under the full use of progress of any academics.

We need recalculation by academics in any field of nation and society.

Politics determine them in reality under any plans and actions.

We are trying to dream a future from our office to the world.
