

Circular economy and zero emissions

January 7th, 2024

KURODA International Consulting LLC

Takeshi Kuroda

With political determination, we will completely transform our economy and industry. Only through these standards will we be allowed to build industry and trade and achieve a complete transformation of our economy.

These will also enable new productivity in all industries under next-generation standards and environments and foster knowledge-intensive sectors.

These will completely transform industry and shift society to next-generation standards while fostering domestic sectors.

This will enable the creation of independent capital in all industries and the development of domestic economic security that aligns with political decisions.

As we can see, all these are a recreation of all realities of society and making a new national environment by its agreement and measures.

This shift to a recycling-oriented society and the agreement to eliminate pollution will make it possible to form a new society and build a new nation.

Furthermore, as all industries transition to new productivity for the next generation, new wealth will be possible to create.

Shifting to the next society must be based on the progress of all industries, which must be possessed by domestic capital, and on the progress of all technologies as new productive capacities.

If the world economy collapses, these are any bases we may need to survive. Despite all these changes, we are still creating new futures.

You may remember what we said: politics always leads to all realities.
