With new finance and digitalization, we may share all standardizations of any fundamentals of reality we may agree on in the digital economic sphere.

All these are equally based on developing new industries under all progressed systems. We determine ourselves to shift to the next societies.

All these spheres share a standard, and they build economic spheres. We need to know we are asking for cooperation in any field of society, and all economies and industries have their creations by themselves with the next society.

We need to consider the economy in depth. An economy creates the next society, and new economic systems and rules may be required for that society.

All of these may result from political decisions. We must also know that the next society will have new livelihood systems.

We need to redesign society and the nation with new measures that may standardize efficiency and productivity in all aspects of technology and systems.

Next-generated technology may be based in the future with all the creation of new livelihoods. And new civilization may be accepted under any progress of all technologies and academics.

We may ask for a new political consensus to recreate any nation's reality and shift to a new civilization.

And all these must require the fundamentals of new philosophies since these are the progress of humanities.

We may know who makes it possible, and you may remember what we have proposed. Politics always has a decision for the world.
