

Creating a digital economic sphere

January 7th, 2024

KURODA International Consulting LLC

Takeshi Kuroda

Under the standardization of any standard of economy, we propose creating our digital economic spheres.

The economy and industry may join all these realities, and we are trying to share the next societies.

These bilateral treaties aim to cooperate in building the next-generation society and fostering the associated industries.

Under all these realities, diplomacy gives it new tools to seek the expansion of any reality of self.

All these may be an agreement of any reality in which we may share all presence and reality in the world.

And we may see that these are the recreation of any nation's reality to shift them to the next societies.

Economic and industrial cooperation, on the other hand, offers and agrees on mutual benefits and a new shared future.

We have all digitalization of any realities in economy and finance, and we are trying to agree on them under the same standard with standardization.

All these are created by all the progress of technologies and industries. The government's significant involvement in these realities will ensure we can mutually realize the transition to next-generation society through shared digitalization.

All this cooperation may change the world power balance and the reality of world politics. We can ask for a new presence in the world.
