Takeshi Kuroda

The development of next-generation industries requires the development of domestic industries and new industrial policies, including the development of industries using these cutting-edge technologies and the introduction of cutting-edge production systems into existing industries.

Our economy is firmly grounded in free trade rules and a free economic system, which are the cornerstones of a thriving economy. With its wealth distribution capabilities, capitalism further fortifies this foundation, ensuring a robust financial structure.

Evidently, the 'next generated reality' is always on the horizon. Whether it's in military or space technology, establishing production bases is necessary. This underscores the role of the economy and industries in shaping our future.

The economy has the truth under its bases, Which occupies any reality under capital by the law of capitalism. Under all truth, if we seek independence from reality, we need a proper economic policy.

Under national security, an economy, diplomacy, and the military are the basis of themselves. We must find that military weapons are merchandise from all economies.

We can see that the free economic system in the USA has grown all new ventures, which are evolutionary progress in themselves. We find the system differing from all nations and alliances of the world. If we are trying to be wise, we need to build our rules that may be more progress than any other reality.

We may understand any social and world system from all the progress of philosophy that is not fake or lies.

At last, these are all determined by political decisions. Then we have to see if they are the kings.
