Takeshi
Kuroda

The ecosystem is maintained in its balance. The total balance has an actual construction in every change. All change is the maintenance of balance, and preexistence has changed, giving reality a fixation.

These are the environment and nature, and the ecosystem has an eternity of change. It is true that a variety of animals and plants have their selves in their differences and take the construction of balance as their selves.

Seeking control of these ecosystems is characteristic of Western civilization. Advances in their intelligence demand its actual possession.

All natural and ecological changes have changed and progressed consistently. All these lives have a reality in the same habit against nature.

They define that there are reference points of balance and that changes have regressions.

A biorhythm at a reference point has an eternity of its return and change. Ecosystems are tolerant, and change regresses to a baseline.

This proposes an understanding that the reality of the earth has a central point. These are the permissiveness of the planet, and the inhabitants live according to it.
