We have a choice: a new future with new technology, as we may call a new technological civilization.

These are the results of history and its progress. Today, we have all new technology and systems, including digitalization with the latest technology and computers.

We have a world map, and we can redesign it.

We can see that the economy makes them realize the world and that we have a free economic system.

The creation of limitless abundance can bring about a shift to a new society, the next society, in cutting-edge systems and an economy with completely different new productivity, improving people's lives far beyond imagination.

These changes appear in part today due to the progress of economies.

Any policy of politics must find all these changes and ask themselves to shift all realities to the future.

We see these shifts in the future through the use of new technologies. These shifts require the reconstruction of all social realities, which must adjust to a new future.

We must consider how we desire to create new societies under any designs. Politics may decide on a new society under new economic systems, which create new societies.

All these are the results of domestic economies, which are directed by politics to renew the realities of society and rebuild with new measures.

So we need all real leadership in politics to guide us in building the future.
