

## MULTI CARD

We propose a unified environment for all cards as well as security in fingerprint authentication.

A pool of memory and basic data provides a data management and customer management environment for cloud access.

In BTOB, they provide the unification of card services in the unified standard, the proposal of the register environment in the application, and the customer management service in the pool of customer data in the cloud. B TO C proposes a personal data management environment.

In addition, we would like to propose a usage environment for card authentication for the share of all electronic devices and automobiles etc...

Participation in devices with self-ID enables access to the host cloud, use of automobiles, devices, computers, etc. along with FineTech and management, subscription services, etc., and enables construction and participation of share services. ..

Also, for building an environment for smart money, we would like to propose a service for registering bank accounts. We would like to propose the construction of an integrated money service as well as the usage environment of the ATM

We would like to standardize these with smartphone applications and propose the construction of a unified service.

I would like to propose these as ID passports in the share economy.

### Service image

Standardized participation in all services, multi-card and ID, standardized in smartphone applications, service access provides money services in bank account registration.

For ID authentication on cloud hosts, we would like to propose authentication services in the share economy, such as using all devices and self-authentication by fingerprint authentication, using devices in the share service, and restoring personal settings.

These provide self-access in the IOT in their service with a security.

- These will standardize access to social services for unified IDs, cards, and smartphone applications, and for the environment at IOT, we would like to propose services as digital passports.
