

Military reorganization

March 22nd, 2024

Kuroda International Consulting

Takeshi Kuroda

Developing a military equivalent to that of the United States and maintaining it to the same standards is the only way that the military can be given its own practicality.

The military defines itself in technology. These mean that the military's development of next-generation technologies will only gain practicality.

These are requirements for the development of a military that is clearly intended for World War III.

The development of new military systems is a proposal to expand military cooperation and alliances and develop them to the same standards.

The production of military weapons for domestic demand necessarily demands all the realities in terms of its advanced technological standards.

Military deployment in the collection and analysis of all information clearly requires military deployment in strategy and tactics.

The establishment of space technologies requires increased self-presence in their operation.

The rest is to demand a real breakthrough in diplomacy and establish one's own security.
