From any point of view of national security, the growth of domestic industry must reach the top trend of reality as we find global enterprises.

These are caused by detailed political plans to shift to a new society under political suggestions.

We may know that we are trying to create new futures through political consensus. New technology and systems must be ruled, and reality must be redesigned into a new society with new lifestyles.

Politics makes decisions, and bureaucrats create new plans and projects. These are the tools that young, talented bureaucrats need to realize hope and the future.

We see that the economy creates a future under its volunteers under a free economic system. However, it is possible to achieve these goals in a command economy.

These require plans to transition to the next generation in administrative guidance for all industries, healthy development of independent capital, collaboration with society, and the development of new social infrastructure.

New social and national systems may base all new realities on their use and create new realities.

As we may find, we must progress in all academics as new philosophies based on new realities.

As we always insist, politics makes their decisions possible. These are the recreation of all nations and societies to reach new futures.

We only need to know if new systems permit all new potentials and possibilities that belong to the past.
