

New world system

July 11th, 2024

KURODA International Consulting

Takeshi Kuroda

With the advent of new technology and a rapidly evolving reality, the prospect of a new world system becomes increasingly plausible, urging us to adapt and embrace change.

While we currently operate within the frameworks of Capitalism, a Free economic system, and Liberalism, the future of our global society could be shaped by a new world system driven by the advancements of new technological civilization.

We advocate for a new socialism that is deeply rooted in humanism, recognizing the inherent value and dignity of every individual as a universal law of humanity.

But we have all competition under its laws and rules. It is based on survival principles, which we may find in the permanence of history.

These laws cause conflicts and wars. How should the world be changed if we shift to a new world system under its agreement?

These historical turning points are the shifts from handicraft to automated production and from analog to digital, and the new technological civilization marks a change from the past justice of survival to the future of creativity.

These are the end of history, which has progressed through competition and wars. The new reality is the rejection of war and an agreement on a new world of coexistence and symbiosis.

They are the end of the past, survival and progress, the proposal for a new future, creativity, and idealism.

So, we propose to share new world systems with all new creations of the new civilization. We are ready for those realities.

These are issues that require serious political debate and the creation of a new world.
