Shifting any reality of the nation to the next generation may appear new efficiency and productivity which allow better life and society.

These are the uses of new technology and systems that make a new society. Next, society must contain any progress and use of all academics, which remake all reality of culture and a nation.

A new standard of society is zero emission and circular economy as a transition to a sustainable society.

To improve society's reality, new infrastructure, communication, and transportation systems must be reestablished under the next standard generated.

These will establish new systems for running the country and maintaining society, such as through the digitalization of finance and the digitalization of connections between local and central administrative systems.

We need to envision a new society that is utterly separate from all existing ones. We must gather all human resources to reestablish and redesign our reality.

These are the standards of all national societies, and any country's culture must be held to the same standard to reestablish itself.

These will bring about a social and industrial transformation, with better societies, new efficiencies, and productivity. Political agreement can be reached to transform all societies into new ones, along with digitalization.

These are the shifts from ancient times to the future. This era transformed all history into new civilizations.
