

Birth of the universe

2024/7/20

Takeshi Kuroda

The hypothesis that the Big Bang created the existence of zero by collapsing it, along with the hypothesis that physical reality in polarity and existence in both polarities always form zero, presents a new theory of the Big Bang and the universe.

If the collapse of zero makes a big bang, it expands with energy to create space to its balance limitation. The energy expansion is not unlimited, but the amount of energy is limited in the amount that I can assume.

These give us consideration of zero if energy expansion is limited. The universe's existence as an expansion of the creation of space seeks balance to hold itself with its existence. These are the idea that the existence of space is a balance of energy.

And if the universe begins with the existence of energy and its expansion, all physical elements are from energy to form themselves.

We can assume that  $m = E/c^2$  is a standard formula in those realities. The theory of special relativity, that time is zero at the speed of light, along with the above statement, allows us to define time as a shared change in  $c$  that exists in all physical reality and that this change forms time.

Under the formula  $E = mc^2$ ,  $c = \sqrt{E/m}$  can be defined. All this is appropriately considerate of the speed of light.

Any mass has the amount of energy as it affects itself with the Perpetual motion of elementary particles.

All heat, sound waves, pressure, and light contain energy. The formula  $E = mc^2$  explains them.

Forming any force may require consideration. If the movement of elementary particles forms force, force is only an energy that Transmits space.

Also, the energy created in the Big Bang is constantly governed by the law of energy conservation. If this physical reality is subject to a return to zero and its repulsive force, then the universe is self-eternal.

The collapse of zero results from the collapse of its balance; then, we see the existence of distortion. It may be the key to explaining all physical reality movements.

All these follow the Inflation theory. But it is possible to think of the reality of distortion as imagined in all its diversity.

If the above theory is true, then distortion is the basis of all physical movement, and it can be said that permanent change exists within it.

These theorems state that energy and the law of conservation of energy shape and govern all reality in the formula  $E=mc^2$ .
