

Transformation into an intellectually integrated industry

April 19th, 2024

Kuroda International Consulting

Takeshi Kuroda

Under a global economy, there is a hierarchy of industries that gather high profit rates of economy.

Our economic policy must urgently pivot to reestablish the economy. The principle of self-sufficiency necessitates all industries to transition to advanced production systems and to develop industries on the highest technological base.

These are the domestic economic policies the nation should ask for in the future. And, to be honest, these are the only possibilities the country should seek.

All these are the necessity of a free trade system and free economic systems.

It must be understood that these intellectual-intensive industries are highly profitable. These are the creations of national wealth.

We must know that all these realities require talent and human resources. This means that national policy must be reconsidered based on these truths.

As we can see, these are the nation's reconstruction efforts, and we have all the necessities of national security.

And more, these are the creation of the future itself.

The industry is creating all new realities. We must also know that rules are free economic and trade systems.

Any alliance could be built under all the necessities of these intellectual-intensive industries in any nation.

We could build our group under economic cooperation.
