

Participation in the space industry

Kuroda International

Takeshi Kuroda

The space industry is the world's most advanced industry, and the development of a base based on contact with space and the manufacture of spacecraft will participate in the space industry in its practicality.

This is a base called Base, which prepares the environment for IT systems that standardize cooperation with space in advanced technology. Adjacent to the supply and conference environment retains its own environment in its practicality.

The production of spacecraft realizes the production of its practical registration in collaboration with the government. They own a self-produced environment in IT management and realize space development in collaboration with governments around the world.

Participation in the stage of space is shared by industry, academia and government, and these provide opportunities for participation.

These are the only requirements in the same reality as Majestic 12 and Roswell 13.
