

New society and life in Society 5.0

Kuroda International

Takeshi Kuroda

It is possible for all people to achieve the next generation of participation in society and life through clear consensus and decisions in politics. This will realize the development of a new society in Society 5.0 under the agreement between the central and local governments.

These will create new social developments in collaboration with governments in domestic industry and provide participation in them to all citizens in the development of social learning opportunities in local governments.

Life security in Basic Income will be realized as the basis of these next-generation societies and living systems.

For these, the local government proposes a clear new social development and presents a clear new social plan in collaboration with industry. These are clearly the transitions to society in the next generation, and the selection of development model cities by the central government will be standardized nationwide and present the creation of new lifestyles.

Equally by IOT with all administrative services opens up that possibility in all realities.

These will realize the development of domestic industry in domestic demand and solve all the closedness in the present situation.

In local cities, the development of conference facilities and resorts based on next-generation standards can be proposed together with the attraction of IT universities for local development in terms of their information power, as the core of their own regions in the world.

These costs are to adopt functional efficiency in advanced technology and to develop a standardized social environment based on low cost standards through industry-academia-government collaboration.
